Tuesday, January 15, 2019 Warm-Up M = O(.71) + 1(0.15) + 2(0.09)t• Let X = the number of living grandparents that a randomly selected adult American has. According to recent General

Social Surveys, its probability distribution is approximately P(0) = 0.71, P(1) = 0.15, P(2) = 0.09, P(3) = 0.03,P(4) = 0.02.

Does this refer to a discrete or continuous random variable? Why? Discrete - whole people

Find the mean and standard deviation of this probability distribution. $\sigma = 0.92$

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion.

Language: I will use correct vocabulary in explaining probability situations.

Geometric Models

M: 0,5

Objectives

- Content Objective: I will use the geometric model to determine probability and expected value.
- Social Objective: I will listen well and participate in the class discussion.
- Language Objective: I will use correct vocabulary in explaining probability situations.

Bernoulli Trials

- The basis for the probability models we will examine in this chapter is the Bernoulli trial.
- A little background on Bernoulli
- We have Bernoulli trials if:
 - there are two possible outcomes (success and failure).

dice > Succes = 5

 (n^{-})

- the probability of success, p, is constant.
- the trials are independent.
- Examples...?

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion.

Language: I will use correct vocabulary in explaining probability situations.

The Geometric Model

- A single Bernoulli trial is usually not all that interesting.
- A Geometric probability model tells us the probability for a random variable that counts the number of Bernoulli trials until the first success. " wat time"
- Geometric models are completely specified by one parameter, p, the probability of success, and are denoted Geom(p).

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion.

The Geometric Model (cont.)

Geometric probability model for Bernoulli trials: <u>Geom(p)</u>

p = probability of success

- q = 1 p = probability of failure
- X = number of trials until the first success occurs

$$P(X = x) = q^{x-1}p$$
$$E(X) = \mu = \frac{1}{p} \qquad \sigma = \sqrt{\frac{q}{p^2}}$$

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion.

Language: I will use correct vocabulary in explaining probability situations.

Example

- Greedy Pig
 - Waiting for a 5…
 - What are the two outcomes?
 - What are their probabilities?
 - Can we assume independent? How do you know? Yes
 - What is our expected value? What does it mean? $\left(\frac{1}{2} + \frac{1}{2}\right) = 1 \times \frac{6}{2}$

not 5

- What is our standard deviation? What does it mean? $\sigma = 5/6/(\frac{1}{2})^2 = 5/6/(\frac{1}{2})^2 = 5.47$
- What's the probability that the first 5 we see is the fourth roll? $P(X=4) = \begin{pmatrix} 5 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} 5 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} 5 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -4 \end{pmatrix} = \begin{pmatrix} -4 \\ -4 \end{pmatrix} \begin{pmatrix} -4 \\ -$

Simulate to see how close we are

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion. Language: I will use correct vocabulary in explaining probability situations.

Slide 17 - 6

Another Example

- A new sales gimmick has 30% of the M&M's covered with speckles. These "groovy" candies are mixed randomly with the normal candies as they are put into the bags for distribution and sale. You buy a bag and remove candies one at a time looking for the speckles.
 - What are the two outcomes? Speckles or not speckles
 - What are their probabilities? 0.3
 - Can we assume independent? How do you know?
 - What's the probability that the first speckled one we see is the fourth candy we get? $P(X = 4) = (0.7)^3 (0.3) = 0.102$

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion.

Language: I will use correct vocabulary in explaining probability situations.

Sample < 10% of population

Independence

10× sample & population

- One of the important requirements for Bernoulli trials is that the trials be independent.
- When we don't have an infinite population, the trials are not independent. But, there is a rule that allows us to pretend we have independent trials:
 - The 10% condition: Bernoulli trials must be independent. If that assumption is violated, it is still okay to proceed as long as the sample is smaller than 10% of the population.

Objectives

Content: I will use the geometric model to determine probability and expected value. Social: I will listen well and participate in the class discussion. Language: I will use correct vocabulary in explaining probability situations.

Objective Check

- Content Objective: I will use the geometric model to determine probability and expected value.
- Social Objective: I will listen well and participate in the class discussion.
- Language Objective: I will use correct vocabulary in explaining probability situations.
