Success = doubles  
Failure = not doubles

## ■ Warm-up

Probability  $\rightarrow$  Distributions  $\rightarrow$

geompdf  $\rightarrow$  one =  
geomcdf  $\rightarrow$  cumulative

- In the board game Monopoly, one way to get out of jail is to roll doubles. The random variable of interest is  $Y$  = number of attempts it takes to roll doubles one time. On each roll, the probability of success is  $1/6$ .

$P(X \leq 3)$

$6/36$

Find the probability that you roll a double within 3 turns.

$$\underbrace{\frac{1}{6}}_{1^{st}} + \underbrace{\left(\frac{5}{6}\right)\left(\frac{1}{6}\right)}_{2^{nd}} + \underbrace{\left(\frac{5}{6}\right)^2\left(\frac{1}{6}\right)}_{3^{rd}} = 0.42$$

$1 - P(\text{not a double})$

- Find the probability that it takes more than 3 turns to roll doubles, and interpret this value in context.

$$P(X > 3) = 1 - 0.42 = 0.58$$

- Check homework
- The Binomial Model

### Objectives

Content: I will use a binomial model to calculate probabilities.

Social: I will listen and participate in the class discussion.

Language: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

# Objectives

- Content Objective: I will use a binomial model to calculate probabilities.
- Social Objective: I will listen and participate in the class discussion.
- Language Objective: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

# The Geometric Model

- The number of trials until our first success.
- Waiting time

# The Binomial Model

→ "out of"  
we know how  
many trials

- The number of successes in a given number of trials

## Objectives

Content: I will use a binomial model to calculate probabilities.

Social: I will listen and participate in the class discussion.

Language: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

$$\text{Binom}(10, \frac{1}{6})$$

# The Binomial Model

- A **Binomial model** tells us the probability for a random variable that counts the number of successes in a fixed number of Bernoulli trials.
- Two parameters define the Binomial model:  $n$ , the number of trials; and,  $p$ , the probability of success. We denote this  $\text{Binom}(n, p)$ .

number  
of trials

probability

## Objectives

Content: I will use a binomial model to calculate probabilities.

Social: I will listen and participate in the class discussion.

Language: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

# The Binomial Model (cont.)

roll 10 times probability of 2

- In  $n$  trials, there are

$${}^n C_k = \frac{n!}{k!(n-k)!} = \binom{n}{k}$$

Handwritten annotations: "trials" points to  $n$  in  ${}^n C_k$ ; "successes" points to  $k$  in  ${}^n C_k$ ; "trials" points to  $n$  in  $\binom{n}{k}$ ; "successes" points to  $k$  in  $\binom{n}{k}$ ; "n choose k" is written above the equation;  $10 C_2$  is written to the right.

ways to have  $k$  successes.

- Read  ${}^n C_k$  or  $\binom{n}{k}$  as “ $n$  choose  $k$ .”

- Note:  $n! = n \times (n-1) \times \dots \times 2 \times 1$ , and  $n!$  is read as “ $n$  factorial.”

## Objectives

Content: I will use a binomial model to calculate probabilities.

Social: I will listen and participate in the class discussion.

Language: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

# The Binomial Model (cont.)

on  
formula  
sheet

Binomial probability model for Bernoulli trials:

Binom( $n, p$ )

$n$  = number of trials

$p$  = probability of success

$q = 1 - p$  = probability of failure

$X$  = # of successes in  $n$  trials

$$\mu = np$$

$$\sigma = \sqrt{npq}$$

$$P(X = x) = {}_n C_x p^x q^{n-x}$$

## Objectives

Content: I will use a binomial model to calculate probabilities.

Social: I will listen and participate in the class discussion.

Language: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

# Example

Back to the speckled M&M's. Remember that 30% of the M&M in a bag are speckled

- If I have a handful of 5 candies, how many speckled ones do I expect to get?

$$\mu = np = 5(0.3) = 1.5 \text{ candies}$$

mean  $E(X)$

- What is the standard deviation of the number of candies I will get?

$$\sigma = \sqrt{npq} = \sqrt{(5)(0.3)(0.7)} = 1.0247 \text{ candies}$$

- What is the probability that we will find 2 speckled ones in a handful of 5 candies?

$$P(X=2) = {}_n C_x p^x q^{n-x} = \frac{{}_5 C_2 (0.3)^2 (0.7)^3}{2! 3!} = 10 (0.3)^2 (0.7)^3$$
$$P(X=2) = {}_5 C_2 (0.3)^2 (0.7)^3 = \frac{5 \cdot 4 \cdot 3!}{2 \cdot 3!} (0.3)^2 (0.7)^3 = 0.308$$

- What is the probability that we will find at least 2 speckled ones in a handful of 5 candies?

$$P(X=2) \text{ OR } P(X=3) \text{ OR } P(X=4) \text{ OR } P(X=5) = 1 - [P(X=1) + P(X=0)]$$

## Objectives

Content: I will use a binomial model to calculate probabilities.

Social: I will listen and participate in the class discussion.

Language: I will clarify which phrases determine a binomial model vs. those which determine a geometric model.

~~binomcdf(5, 0.3, 2, 5)~~

Probability  
↳ Distributions

binomialpdf  
↳ "point" = one value  
binomialcdf  
↳ cumulative multiple values

$P(X=2) = \begin{matrix} n=5 \\ p=0.3 \\ \text{X-value (successes)} = 2 \end{matrix} \rightarrow 0.308$

$P(X \text{ at least } 2) = \begin{matrix} n=5 \\ p=0.3 \\ \text{lower bound} = 2 \\ \text{upper bound} = 5 \end{matrix} \rightarrow 0.47$

"at least"  
 $\leq$   $\geq$

# Another Example

"What is the expected value or avg?"  
 $\mu = nP$

- Back to the dice rolls. What is the probability that we will roll 3 5's in a group of 20 rolls?

binomial cdf or pdf  $\rightarrow$  0.237 ★

- What is the probability that we will roll at most 3 5's in a group of 20 rolls?

cdf  $\ell$ bound = 0  $\rightarrow$  0.566  
 upbound = 3 ★

- What is the probability that there will be some 5's in a group of 20 rolls?

cdf  $\rightarrow$   $\ell$ bound = 1 0.97  
 upbound = 20  $1 - \text{pdf}(0)$   $20C_0 \cdot \frac{20!}{0!20!} \left(\frac{1}{6}\right)^0 \left(\frac{5}{6}\right)^{20}$   
 1.1

- What is the probability that the first 5 is the 8<sup>th</sup> or 9<sup>th</sup> roll?

no "n" : geometric

$$\left(\frac{5}{6}\right)^7 \left(\frac{1}{6}\right) + \left(\frac{5}{6}\right)^8 \left(\frac{1}{6}\right)$$

# Calculator “Tricks”

# Scrabble

- In the game of scrabble, each player begins by drawing 7 tiles from a bag containing 100 tiles. There are 42 vowels, 56 consonants, and 2 blank tiles in the bag.
  - What is the probability of all 7 drawn being a vowel?
  - What is the probability that some of the 7 are vowels?
  - What is the probability that the vowel is the 2<sup>nd</sup> or 3<sup>rd</sup> draw?
  - How long should we expect to wait to draw a vowel?

## Objectives
