Warm-up

We are 95% confident that the true average length of tropical flowers is 26.341 ± 6.213 inches

Write the conclusions for the following confidence intervals:
between 20.128 and 32.55

- Fred measured the lengths of 23 tropical flowers and with a 95% confidence level, he calculated a confidence interval of 26.341 ± 6.213 inches.

We are 99% confident that the true average cc's of acid in aspirin is 325.623 ± 2.216 .

- A chemist measured the amount of acetylsalicylic acid in tablets of aspirin and, using a 99% confidence level, calculated a confidence interval of 325.623 ± 2.216 cc's

Discuss test results

Interpreting the confidence interval

GOSSET'S T

William S. Gosset, an employee of the Guinness Brewery in Dublin, Ireland, worked long and hard to find out what the sampling model was.

GOSSET'S T

The sampling model that Gosset found has been known as **Student's t** .

GOSSET'S T

The Student's t -models form a whole family of related distributions that depend on a parameter known as **degrees of freedom**.

- We often denote degrees of freedom as df , and the model as t_{df} .

Z

t_6
 t_{df}

$n-1$

WHAT IS THIS DEGREE OF FREEDOM?

A CONFIDENCE INTERVAL FOR MEANS?

As the degrees of freedom increase, the t -models look more and more like the Normal.

In fact, the t -model with infinite degrees of freedom is exactly Normal.

A QUICK EXPERIMENT

Compare z-distribution to t-distribution
